Not illustrated. 1896 Excerpt: . current lags behind the primary by an angle of  $90^\circ$  plus an angle  $\phi$ , whose tangent is--- If there is no condenser in the secondary, this lag is  $90^\circ - \arctan \frac{R}{X}$ , which is in accordance with the simple transformer diagram, Chapter V. See also equation (31), Chapter VI. A condenser in the secondary might reduce this angle to  $90^\circ$  or make it even less, as is seen from the equations, and will be shown later graphically. Make and Break with Harmonic Electromotive Force.--In the discussion of the current flow in the primary and secondary of a transformer subjected to an harmonic electromotive force, the exponential terms which constitute the complementary function have been omitted from the equations, and the currents are simple harmonic functions of the time. These exponential terms modify the current for a short time after the make, but their effects rapidly diminish, and become negligible after a fraction of a second. The exponential terms have been discussed in the preceding chapter, and the effects there described are to be superimposed upon the simple harmonic flow of current which would take place if they were not present. Whether these terms are oscillatory or not depends, as before, upon the relation between the various constants of the circuits. When the complementary function is oscillatory, the resultant current for a short time oscillates about its final sinusoidal form, its form depending upon the relation between the period of the impressed electromotive force and the natural period of...
